

Experiment 08 : YACC Tool

Learning Objective: Student should be able to Build Parser Generator using YACC tool.

Tools: Open Source tool (Ubuntu , LEX tool), Notepad++)

Theory:

A parser generator is a program that takes as input a specification of a syntax, and produces as output a procedure for recognizing that language. Historically, they are also called compiler-compilers.

YACC (yet another compiler-compiler) is an **LALR(1)** (LookAhead, Left-to-right, Rightmost derivation producer with 1 lookahead token) parser generator. YACC was originally designed for being complemented by Lex.

Input File:

YACC input file is divided in three parts.

`/* definitions */`

`....`

`%%`

`/* rules */`

`....`

`%%`

`/* auxiliary routines */`

`....`

Input File: Definition Part:

- The definition part includes information about the tokens used in the syntax definition:
- `%token NUMBER`
- `%token ID`
- Yacc automatically assigns numbers for tokens, but it can be overridden by `%token NUMBER 621`
- Yacc also recognizes single characters as tokens. Therefore, assigned token numbers should no overlap ASCII codes.
- The definition part can include C code external to the definition of the parser and variable declarations, within `%{` and `%}` in the first column.
- It can also include the specification of the starting symbol in the grammar:
`%start nonterminal`

Input File: Rule Part:

- The rules part contains grammar definition in a modified BNF form.
- Actions is C code in `{ }` and can be embedded inside (Translation schemes).

Input File: Auxiliary Routines Part:

- The auxiliary routines part is only C code.
- It includes function definitions for every function needed in rules part.
- It can also contain the `main()` function definition if the parser is going to be run as a program.
- The `main()` function must call the function `yyparse()`.

Input File:

- If `yylex()` is not defined in the auxiliary routines sections, then it should be included:

```
#include "lex.yy.c"
```

- YACC input file generally finishes with:
.y

Output Files:

- The output of YACC is a file named **y.tab.c**
- If it contains the **main()** definition, it must be compiled to be executable.
- Otherwise, the code can be an external function definition for the function **int yyparse()**
- If called with the **-d** option in the command line, Yacc produces as output a header file **y.tab.h** with all its specific definition (particularly important are token definitions to be included, for example, in a Lex input file).
- If called with the **-v** option, Yacc produces as output a file **y.output** containing a textual description of the LALR(1) parsing table used by the parser. This is useful for tracking down how the parser solves conflicts.

Example:

Yacc File (.y)

<pre>%{ #include <ctype.h> #include <stdio.h> #define YYSTYPE double }% %% Lines : Lines S '\n' { printf("OK \n"); } S '\n' error '\n' { yyerror("Error: reenter last line:"); yyerrok; }; S : '(' S ')'</pre>	<pre> '[' S ']' /* empty */ ; %% #include "lex.yy.c" void yyerror(char * s) { fprintf(stderr, "%s\n", s); } int main(void) { return yyparse(); }</pre>
---	---

Lex File (.l)

```
%{
}%
%%
[ \t] { /* skip blanks and tabs */ }
\n|. { return yytext[0]; }
%%
```

For Compiling YACC Program:

- Write lex program in a file file.l and yacc in a file file.y
- Open Terminal and Navigate to the Directory where you have saved the files.
- type lex file.l
- type yacc file.y
- type cc lex.yy.c y.tab.h -ll
- type ./a.out

Code: calc.l

```
%{
#include<stdio.h>
#include "y.tab.h"
extern int yyval;

}

[ \t] ;
[ \n] return 0;
. return yytext[0];
```

```
%}

%%
[0-9]+ {
    yyval=atoi(yytext);
    return NUMBER;
}

calc.y

%{
#include<stdio.h>
int flag=0;
%}

%token NUMBER
%left '+' '-'
%left '*' '/' '%'
%left '(' ')'

%%
ArithmeticExpression: E{
    printf("\nResult=%d\n",
    $$);
    return 0;
};
E: E '+' E {$$=$1+$3;}
| E '-' E {$$=$1-$3;}
| E '*' E {$$=$1*$3;}
| E '/' E {$$=$1/$3;}
| E '%' E {$$=$1%$3;}

void yywrap()
{
    return 1;
}

| '(' E ')' {$$=$2;}
| NUMBER {$$=$1;}
;
%%

void main()
{
    printf("\nEnter Any Arithmetic Expression
    which can have operations Addition,
    Subtraction, Multiplication, Division,
    Modulus and Round brackets:\n");
    yyparse();
    if(flag==0)
        printf("\nEnter arithmetic expression
        is Valid\n\n");
    }
    void yyerror()
    {
        printf("\nEnter arithmetic expression
        is Invalid\n\n");
        flag=1;
    }
}
```

Output:

```
admins@UbuntuSPCC:~$ lex calc.l
admins@UbuntuSPCC:~$ yacc calc.y
admins@UbuntuSPCC:~$ gcc lex.yy.c y.tab.c -w
admins@UbuntuSPCC:~$ ./a.out

Enter any Arithmetic Expression which can have operations Addition, Subtraction, Multiplication, Division, Modulus and Round Bracket
s:
4+5

Result=9

Entered arithmetic expression is valid

admins@UbuntuSPCC:~$ ./a.out

Enter any Arithmetic Expression which can have operations Addition, Subtraction, Multiplication, Division, Modulus and Round Bracket
s:
4-5

Result=-1

Entered arithmetic expression is valid

admins@UbuntuSPCC:~$ ./a.out

Enter any Arithmetic Expression which can have operations Addition, Subtraction, Multiplication, Division, Modulus and Round Bracket
s:
4*5

Result=20

Entered arithmetic expression is valid
```

```
admins@UbuntuSPCC:~$ ./a.out

Enter any Arithmetic Expression which can have operations Addition, Subtraction, Multiplication, Division, Modulus and Round Bracket
s:
(6+4)/2

Result=5

Entered arithmetic expression is valid

admins@UbuntuSPCC:~$ ./a.out

Enter any Arithmetic Expression which can have operations Addition, Subtraction, Multiplication, Division, Modulus and Round Bracket
s:
(6+4)*2

Result=20

Entered arithmetic expression is valid

admins@UbuntuSPCC:~$ █
```

Result and Discussion:

Learning Outcomes: The student should have the ability to

LO1 **Define** Context Free Grammar.

LO2: **Describe** the structure of YACC specification.

LO3: **Apply** YACC Compiler for Automatic Generation of Parser Generator.

LO4: **Construct** Parser Generator using open source tool for compiler design.

Course Outcomes: Upon completion of the course students will be able to Analyze the analysis and synthesis phase of compiler for writhing application programs and construct different parsers for given context free grammars.

Conclusion:

For Faculty Use

Correction Parameters	Formative Assessment [40%]	Timely completion of Practical [40%]	Attendance / Learning Attitude [20%]
